

Advanced Engineering Analysis
Introduction to Finite Difference Analysis
Daniele Chiappini

The aim of this course is to provide the basis for the finite difference analysis. This powerful tool may be adopted for a large number of engineering problems. The course is structured so to give to attendants a general overview of the methods which may be used while facing up with a differential equation (both ordinary and partial). More specifically the first part of the course is addressed to the definition of the discrete forms of derivatives which are most commonly used in applications. After, the Ordinary Differential Equations (ODE's) have analysed with referring both to Boundary Values Problems as well as to Initial Values Problems. ODE's have solved in case of system of equations as well, and the way to pass from a high order equation to a system of first order ones is presented as well. Thus, the focus moves towards the numerical solution of Partial Differential Equations (PDE's) both at steady state and during transients. Particular attention has addressed to the distinction between explicit and implicit methods with defining to stability conditions when needed. Finally some basics on Computational Fluid-Dynamics will be provided with showing one of the possible approaches to solve the Navier-Stokes equations.

The course is organized in 8 lessons (expected duration 3h). The first part is purely theoretical, while within the second one some applications will be developed. It is warmly suggested to have at least one laptop every two students. Most probably exercises will be developed in Octave.

Room: Room D - Unicusano - Via don Carlo Gnocchi 3, 00166, Rome(RM)
Contact: daniele.chiappini@unicusano.it

Tentative Outline:

- Lesson 1 - *Monday 04th May 2020 - 3h:*
 - Introduction to numerical methods;
 - Solution of Ordinary Differential Equations;
 - Solution of System of Ordinary Differential Equations
- Lesson 2 - *Thursday 07th May 2020 - 3h:*
 - Solution of Elliptic Equations
- Lesson 3 - *Monday 11th May 2020 - 3h:*
 - Iterative Solution of Linear Systems
- Lesson 4 - *Thursday 14th May 2020 - 3h:*
 - Solution of Parabolic Equations - 1D case
- Lesson 5 - *Monday 18th May 2020 - 3h:*
 - Solution of Parabolic Equations - 2D case
- Lesson 6 - *Thursday 21st May 2020 - 3h:*
 - Solution of Hyperbolic Equations - 1D case
- Lesson 7 - *Monday 25th May 2020 - 3h:*
 - Solution of Hyperbolic Equations - 2D case
- Lesson 8 - *Thursday 28th May 2020 - 3h:*
 - Basics of Computational Fluid-Dynamics - 1D and 2D cases
